

ABSTRACT

A blue color filter is made to contain a first colorant represented by structural formula (1) in the specification and a binder resin, and also contain a second colorant that absorbs fluorescence from the first colorant and does not have a fluorescence maximum in a visible wavelength region, whereby there can be provided a blue color filter suitable for an organic EL display for which the purity of the blue color and the transmissivity are high and also contrast is good, and an organic EL device using this blue color filter.
